

PENETRATION TESTING FROM THE EXPERTS

Whether you need to meet regulations, demonstrate compliance or you simply want to know where the vulnerabilities are within your business, a penetration test will help identify how secure your technology, processes, procedures and people really are.

All businesses can benefit from undertaking a penetration test, because the first step in protecting your business from today's constantly evolving threat landscape is knowing where your vulnerabilities are so you can address them.

A penetration test is an absolute essential, where businesses:

-  Have applications that are client facing
-  Have a team of app developers
-  Are subject to regulations like DORA; MFID; PCI-DSS; KCSIE; NIS2; Cyber Essentials and many more
-  Are third-party supplier to a business / organisation that is subject to regulation
-  Are looking to undertake Cyber Insurance

What is a Penetration Test?

A penetration test is a point in time assessment of a company's external, internal and public facing infrastructure. Its aim is to identify and confirm vulnerabilities, to allow organisations to remediate any risks and weaknesses discovered.

How does the Koris365 Penetration Test work?

We test all of the software and technical infrastructure that keeps your business systems up and running. Identifying vulnerabilities that may exist, for example; in authentication; cross-site scripting; source code; logic; and insecure network configurations.

Our testing can cover external facing infrastructure, such as websites, login portals, applications and cloud services, and or, your internal infrastructure looking for vulnerabilities and weaknesses in your servers, switches, routers and end points.
